Title of the invention:

NEW ARYL- AND HETEROARYLETHENYLENE DERIVATIVES AND PROCESS FOR
THEIR PREPARATION

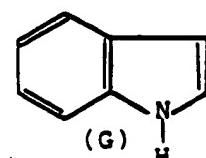

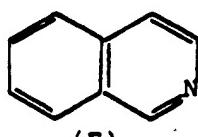

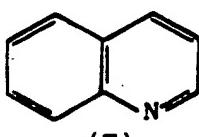

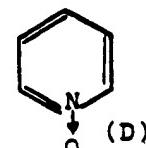

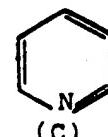

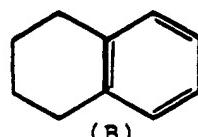

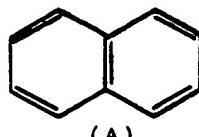

The present invention relates to new aryl- and heteroaryl-
5 ethenylene derivatives, to a process for their preparation,
to pharmaceutical compositions containing them and to their
use as therapeutic agents.

The present invention provides compounds having the
following general formula (I)

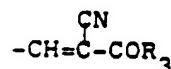

10 wherein

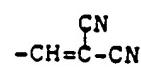

Y is a mono- or bicyclic ring system chosen from (A), (B),
(C), (D), (E), (F) and (G)

R is a group of formula (a), (b), (c), (d), (e), (f), (g), (h), (i) or (j)

(a)

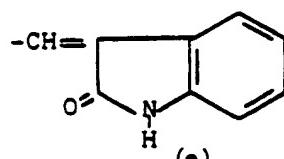

(b)

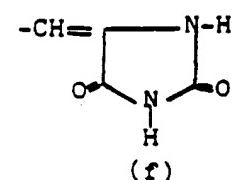

(c)

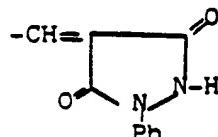

(d)

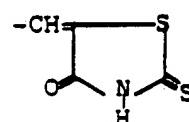

(e)

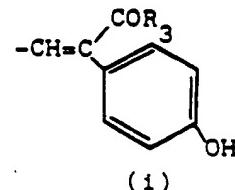

(f)

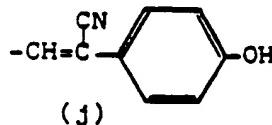

(g)

(h)

(i)

in which R₃ is -OH or -NH₂ and Ph means phenyl;

R₁ is hydrogen, C₁-C₆ alkyl or C₂-C₆ alkanoyl; R₂ is hydrogen, halogen, cyano or C₁-C₆ alkyl;

n is zero or an integer of 1 to 3; m is zero

- 3 -

or an integer of 1 to 3 when Y is a ring system (A); it is zero, 1 or 2 when Y is a ring system (B), (E), (F) or (G); or it is zero or 1 when Y is a ring system (C) or (D); and the pharmaceutically acceptable salts thereof; and wherein each of the substituents R, OR₁ and R₂ may be independently on either of the aryl or heteroaryl moieties of the bicyclic ring system (A), (E), (F) and (G), whereas only the benzene moiety may be substituted in the bicyclic ring system (B).

The invention includes within its scope all the possible isomers, stereoisomers, in particular Z and E isomers and their mixtures, and the metabolites and the metabolic precursors or bio-precursors (otherwise known as pro-drugs) of the compounds of formula (I).

The substituent R is preferably linked to position 1 or 2 in ring system (A) and (B), to position 4 in ring system (C) and (D), to position 5 or 8 in ring system (E) and (F) and to position 3 or 7 in ring system (G). The substituent R₂ may be independently on either of the rings in the bicyclic ring systems (A), (B), (E), (F) and (G).

When Y is a bicyclic ring system as defined under (A), (E) or (F) the -OR₁ groups are preferably on the same benzene moiety as the R group. In any of ring systems (A) to (G), the substituent R₂ is preferably located on the same 6-membered ring as the substituent -OR₁ in the ortho-, meta- or para- position with respect to -OR₁. Preferably R₂ is located in a position ortho- or para- to -OR₁.

A substituent -OR₁ is preferably linked to position 1, 2, 3, 4, 5 or 8, in particular to position 1, 2, 3 or 4, in ring systems (A) and (B). A substituent -OR₁ is preferably linked to position 2, 3, 4 or 5, in particular to position 3, 4 or 5, in ring systems (C) and (D). A substituent -OR₁ is preferably linked to position 3, 4, 5, 6, 7 or 8, in particular to position 5, 6, 7 or 8, in ring system (E) and (F). A substituent -OR₁ is preferably linked to position 3, 4, 5, 6 or 7, in particular to position 4, 5,

- 4 -

6 or 7 in ring system (G). Of course only one of the substituents R₁, -OR₁ and R₂ can be linked to the same position in ring systems (A) to (G).

When n is 2 or 3, the -OR₁ groups may be the same or different.

The alkyl groups, and the alkyl moiety in the alkanoyl groups, may be a branched or straight alkyl chain. A C₁-C₆ alkyl group is preferably a C₁-C₄ alkyl group, e.g. methyl, ethyl, propyl, isopropyl, butyl, sec-butyl or tert-butyl, in particular methyl or ethyl. A C₂-C₆ alkanoyl group is preferably a C₂-C₄ alkanoyl group, in particular acetyl, propionyl or butyryl.

A halogen is, preferably, chlorine, bromine or fluorine, in particular bromine.

Pharmaceutically acceptable salts of the compounds of the invention include acid addition salts, with inorganic, e.g. nitric, hydrochloric, hydrobromic, sulphuric, perchloric and phosphoric acids, or organic, e.g. acetic, propionic, glycolic, lactic, oxalic, malonic, malic, maleic, tartaric, citric, benzoic, cinnamic, mandelic and salicylic acids, and salts with inorganic, e.g. alkali metal, especially sodium or potassium, bases or alkaline-earth metal, especially calcium or magnesium bases, or with organic bases, e.g. alkylamines, preferably triethyl-amine.

As stated above the present invention also includes within its scope pharmaceutically acceptable bio-precursors (otherwise known as pro-drugs) of the compounds of formula (I), i.e. compounds which have a different formula to formula (I) above but which nevertheless upon administration to a human being are converted directly or indirectly in vivo into a compound of formula (I). Preferred compounds of the invention are the compounds of formula (I), wherein

- 5 -

Y is a monocyclic or bicyclic ring system/(A) to (G), as defined above;

R is a group of formula (a), (b), (c), (d), (e), (i) or (j) as defined above;

5 R₁ is hydrogen, C₁-C₄ alkyl or C₂-C₄ alkanoyl;

R₂ is hydrogen;

n is a defined above; and the pharmaceutically acceptable salts thereof.

More preferred compounds of the invention are the compounds of
10 formula (I), wherein

Y is a bicyclic ring system of formula (A), (B) or (E), as defined above;

R is a group of formula (a),(d),(e),(i) or (j), as defined above;

R₁ and R₂ are hydrogen;

15 n is zero or 1; and the pharmaceutically acceptable salts thereof.

The compounds of the invention, and the pharmaceutically acceptable salts thereof, can be obtained by a process comprising the condensation of an aldehyde of formula (II)

wherein

Y, R₁, R₂ and n are as defined above with a compound of formula (a'), (b'), (c'), (d'), (e'), (f'), (g'), (h'), (i') or (j'), respectively,

(a')

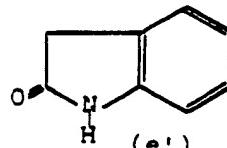

(b')

- 10 -

wherein R₃ and Ph are as defined above; and if desired, converting a compound of formula (I) into another compound of formula (I), and/or, if desired, converting a compound of formula (I) into a pharmaceutically acceptable salt thereof, and/or, if desired, converting a salt into a free compound, and/or, if desired, separating a mixture of isomers of a compound of formula (I) into the single isomers. The reaction of a compound of formula (II) with a compound of formula (a'), (b'), (c'), (d'), (e'), (f'), (g'), (h'), (i') or (j'), is an analogy process which can be carried out according to known methods, as herebelow described; preferably in the presence of a basic catalyst, e.g. pyridine, piperidine, dimethylamine, or a suitable alkali metal hydroxide or alkoxide.

For example the reaction of a compound of formula (II) with a compound of formula (a'), (b'), (c'), (e'), (f'), (g') or (h'), respectively, may be carried out under the conditions of the Knoevenagel reactions as described e.g. by G. Jones in Organic Reactions 15, 204 (1967). Suitable catalyst are organic bases such as pyridine, piperidine or diethylamine. The condensation may be performed in an inert organic solvent e.g. pyridine, ethanol, methanol, benzene or dioxane at temperature ranging from about 0°C to about 100°C. Preferably the reaction is carried out in warm ethanol solution in the presence of piperidine catalyst.

- 11 -

- The reaction of a compound of formula (II) with a compound of formula (d') may be carried out according to the Knoevenagel method as described above but using special conditions. Especially higher reaction temperatures are used in consideration of the fact that during the condensation also a decarboxylation occurs. For instance the condensation may be performed in an organic base such as pyridine (which at same time is solvent and catalyst) at temperatures ranging from about 50° to about 140°C.
- The reaction of a compound of formula (II) with a compound of formula (i') may be carried out as described by R.E. Buckles et al. in J.Am.Chem.Soc. 73, 4972 (1951). According to this method equimolar amounts of the aromatic aldehyde and the phenylacetic derivative are reacted in 3-5 molequivalents of acetic anhydride in the presence of about 1 moleequivalent triethylamine at temperatures ranging from about 100 to about 140°C.
- The condensation of a compound of formula (II) with a compound of formula (j') may be carried out in alcoholic solution using a metal alkoxide, e.g. sodium ethoxide, potassium t-butoxide, or a metal hydroxide, e.g. sodium hydroxide, as catalyst; at temperatures ranging from about 0°C to about 100°C. Preferably equimolar amounts of reactants are condensed in ethanol solution at room temperature in the presence of sodium ethoxide using about 1 moleequivalent for each acidic hydrogen of the latter.
- A compound of formula (I) can be converted into another compound of formula (I) according to known methods. For example the de-etherification of a compound of formula (I), wherein one or more R_1 substituents are C_1-C_6 alkyl, so as to

- 12 -

obtain a compound of formula (I) wherein one or more R₁ substituents / are hydrogen may be performed by well known methods in organic chemistry. In the case of a phenolic methyl ether the cleavage can be carried out for example
5 with boron tribromide as described by J.F.N. McOmie in Tetrahedron 24, 2289 (1968). It is advisable to use about 1 mole of boron tribromide for each ether / group, together with an extra mol of reagent for each group containing a potentially basic nitrogen or oxygen. The reaction may be performed in
10 an inert organic solvent such as methylene chloride, pentan inert, e.g. or benzene under an / nitrogen, atmosphere at temperatures ranging from about -78°C to about room temperature.
The acylation of a compound of formula (I) wherein one or
more R₁ substituent is hydrogen, so as to obtain a correspond-
15 ing compound of formula (I) wherein one or more R₁ substituent is a C₂-C₆ alkanoyl group, may be obtained by reaction with a reactive derivative of a suitable carboxylic acid, such as an anhydride or halide, in the presence of a basic agent, at temperatures ranging from about 0°C to about 50°C. Preferably
20 the acylation is carried out by reaction with the respectiv anhydride in the presence of an organic base, such as pyridine. Analogously the conversion of a compound of formula (I),
wherein R is a group of formula -CH=C-COOH or -CH=CH-COOH,
25 into another compound of formula (I) wherein R is a group of formula -CH=C-CONH₂ or -CH=CH-CONH₂, respectively, may be carried out according to known methods. For example a reactive

- 13 -

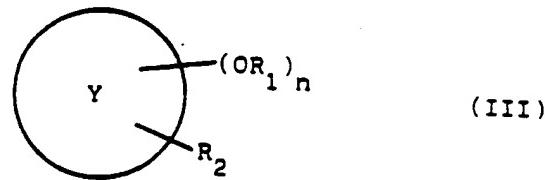

derivative of the carboxylic acid, e.g. a suitable halide, preferably the chloride, can be reacted with aqueous ammonium hydroxide solution at a temperature ranging from about 5°C to about 40°C.

5 The optional salification of a compound of formula (I) as well as the conversion of a salt into the free compound and the separation of a mixture of isomers into the single isomers may be carried out by conventional methods.

10 For example the separation of a mixture of geometric isomers, e.g. cis- and trans-isomers, may be carried out by fractional crystallization from a suitable solvent or by chromatography, either column chromatography or high pressure liquid chromatography.

The compounds of formula (II) may be obtained according to known methods from compounds of formula (III).

15

wherein Y, R₁, R₂ and n are as defined above.

For example the phenolic compound of formula (III) may be treated with chloroform and alkali hydroxides in an aqueous or aqueous alcoholic solution according to the well known method of Reimer-Tiemann. If the starting material is an aromatic methylether the method described by N.S. Narasimhan et al. in Tetrahedron 31, 1005 (1975) can be applied. Accordingly th

- 14 -

methylether of formula (III) is lithiated with butyl lithium in refluxing ether. Treatment of the organometallic compound with N-methylformanilide furnishes the formyl derivative. The compounds of formula (III) are known or may be obtained
5 by known methods from known compounds.

PHARMACOLOGY

The compounds of the present invention possess specific tyrosine kinase inhibiting activity. Hence they can be useful in the treatment of cancer and other pathological proliferative
10 conditions.

Recent studies on the molecular basis of neoplastic transformation have identified a family of genes, designed oncogenes, whose aberrant expression causes tumorigenesis.

For example, the RNA tumor viruses possess such an oncogene
15 sequence whose expression determines neoplastic conversion of infected cells. Several of their oncogene-encoded proteins, such as pp60^{v-src}, p70gag-yes, p130^{gag-fps} and p70^{gag-fgr} display protein tyrosine kinase activity, that is they catalyse the transfer of the γ -phosphate from adenosine triphosphate
20 (ATP) to tyrosine residues in protein substrate. In normal cells, several growth factor receptors, for example the receptors for PDGF, EGF, α -TGF and insulin, display tyrosine kinase activity. Binding of the growth factor (GF) activates the receptor tyrosine kinase to undergo autophosphorylation and to phosphorylate
25 closely adjacent molecules on tyrosine.

Therefore, it is thought that the phosphorylation of these

- 15 -

tyrosine kinase receptors plays an important role in signal transduction and that the principal function of tyrosin kinase activity in normal cells is to regulate cell growth. Perturbation of this activity by oncogenic tyrosine kinases that are either overproduced and/or display altered substrate specificity may cause loss of growth control and/or neoplastic transformation. Accordingly, a specific inhibitor of tyrosine kinases can be useful in investigating the mechanism of carcinogenesis, cell proliferation and differentiation and it can be effective in prevention and chemotherapy of cancer and in other pathological proliferative conditions.

The tyrosine specific protein kinase activity of these compounds is shown, e.g., by the fact that they are active in the in vitro test described by B. Ferguson et al., in J. Biol. Chem. 1985, 260, 3652.

The enzyme used is the Abelson tyrosine kinase p 60^{v-abl}. Its production and isolation is performed according to a modification of the method of B. Ferguson et al. (*ibidem*). As substrate λ -casein or (Val⁵)-angiotensin is used.

The inhibitor is preincubated with the enzyme for 5 min at 25°C. The reaction conditions are: 100 mM MOPS buffer, 10 mM MgCl₂, 2 μ M (γ -³²P) ATP (6Ci/mmol), 1 mg/ml λ -casein /an alternative substrate is (Val⁵) angiotensin II/ and 7.5 μ g/ml of enzyme in a total volume of 30 μ l and pH 7.0.

The reaction is incubated for 10 min at 25°C.

- 16 -

- Trichloroacetic acid precipitation of protein is followed by rapid filtration and quantification of phosphorylated substrate by a liquid scintillation counter. Alternatively the reaction mixture is subjected to sodium dodecyl sulfate - polyacrylamide electrophoresis and the phosphorylated substrate measured by autoradiography or P^{32} -counting of the excised spot.
- In view of their high activity and low toxicity, the compounds of the invention can be used safely in medicine.
- For example, the approximate acute toxicity (LD_{50}) of the compounds of the invention in the mouse, determined by single administration of increasing doses and measured on the seventh day after the treatment was found to be negligible.
- The compounds of the invention can be administered in a variety of dosage forms, e.g. orally, in the form of tablets, capsules, sugar or film coated tablets, liquid solutions or suspensions; rectally, in the form of suppositories; parenterally, e.g. intramuscularly, or by intravenous injection or infusion; or topically.
- The dosage depends on the age, weight, conditions of the patient and administration route; for example the dosage adopted for oral administration to adult humans may range from about 10 to about 150-200 mg pro dose, from 1 to 5 times daily.
- Of course, these dosage regimens may be adjusted to provide the optimal therapeutic response.

- 17 -

The invention includes pharmaceutical compositions comprising a compound of the invention in association with a pharmaceutically acceptable excipient (which can be a carrier or diluent).

5 The pharmaceutical compositions containing the compounds of the invention are usually prepared following conventional methods and are administered in a pharmaceutically suitable form.

For example, the solid oral forms may contain, together with
10 the active compound, diluents, e.g., lactose, dextrose, saccharose, cellulose, corn starch or potato starch; lubricants, e.g. silica, talc, stearic acid, magnesium or calcium stearate, and/or polyethylene glycols; binding agents, e.g. starches, arabic gums, gelatin, methylcellulose, carboxymethylcellulose
15 or polyvinyl pyrrolidone; disaggregating agents, e.g. a starch, alginic acid, alginates or sodium starch glycolate, effervesing mixtures; dyestuffs; sweeteners; wetting agents, such as lecithin, polysorbates, laurylsulphates; and, in general, non-toxic and pharmacologically inactive substances used in
20 pharmaceutical formulations. Said pharmaceutical preparations may be manufactured in known manner, for example, by means of mixing, granulating, tabletting sugar-coating or film-coating processes.

The liquid dispersion for oral administration may be e.g.
25 syrups, emulsions and suspensions.

The syrup may contain as carrier, for example, saccharose or

- 18 -

saccharose with glycerine and/or mannitol and/or sorbitol. The suspensions and the emulsions may contain as carrier, for example, a natural gum, agar, sodium alginate, pectin, methylcellulose, carboxymethylcellulose or polyvinyl alcohol.

- 5 The suspensions or solutions for intramuscular injections may contain, together with the active compound, a pharmaceutically acceptable carrier, e.g. sterile water, olive oil, ethyl oleate, glycols, e.g. propylene glycol, and, if desired, a suitable amount of lidocaine hydrochloride. The
10 solutions for intravenous injections or infusion may contain as carrier, for example, sterile water or, preferably, they may be in the form of sterile, aqueous, isotonic saline solutions.
- 15 The suppositories may contain together with the active compound a pharmaceutically acceptable carrier, e.g. cocoa-butter, polyethylene glycol, a polyoxyethylene sorbitan fatty acid ester surfactant or lecithin.
- 20 Compositions for topical application e.g., creams, lotions or pastes, can be prepared by admixing the active ingredient with a conventional oleaginous or emulsifying excipient. The following examples illustrate but do not limit the invention.

Example 1

2-cyano-3-(8-hydroxyquinolin-5-yl) acrylamide

[I, Y = E, R = a, R₁ = R₂ = H, n = 1, R₃ = NH₂].

A solution of 5-formyl-8-hydroxyquinoline (173 mg, 1 mmol),
5 cyanoacetamide (92 mg; 1.1 mmol) and piperidine (60 mg,
0.7 mmol) in absolute ethanol (20 ml) is heated for 4 h at
50°C. The reaction mixture is chilled to 0-5°C, the
precipitate filtered, the residue washed with ice-cooled
ethanol and then dried under vacuum.

10 Pure title compound is so obtained in 70% yield (167 mg).
Compounds of higher purity are obtained by crystallization
from ethanol, m.p. 275°.

The granulate is dried, comminuted on a sieve of 1.4 mm mesh size, then the remaining quantity of starch, talc and magnesium stearate are added, carefully mixed and processed into tablets.

15 Example 11

Capsules, each dosed at 0.200 g and containing 20 mg of the active substance can be prepared.

Composition for 500 capsules:

2-cyano-3-(3-hydroxynaphth-2-yl)acrylamide 10 g

20 Lactose 80 g

Corn starch 5 g

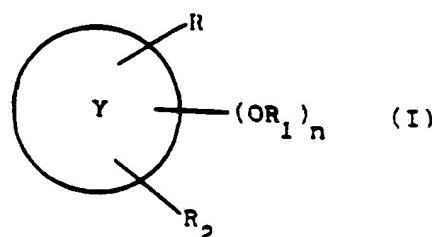

Magnesium stearate 5 g

This formulation is encapsulated in two-piece hard gelatin capsules and dosed at 0.200 g for each capsule.

5 in which R_3 is $-OH$ or $-NH_2$ and Ph means phenyl;
R₁ is hydrogen, C₁-C₆ alkyl or C₂-C₆ alkanoyl; R₂ is
hydrogen, halogen, cyano or C₁-C₆ alkyl;
n is zero or an integer of 1 to 3: n is zero
or an integer of 1 to 3 when Y is a ring system (A); it is
zero, 1 or 2 when Y is a ring systems (B), (E), (F) or (G);
or it is/1 when Y is a ring systems (C) or (D); and the
pharmaceutically acceptable salts thereof; and wherein each
of the substituents R, OR₁ and R₂ may be independently on
either of the aryl or heteroaryl moieties of the bicyclic
ring system (A), (E), (F) and (G), whereas only the benzene
moiety may be substituted in the bicyclic ring system (B).

15 2. A compound of formula (I), according to claim 1, wherein
Y is a monocyclic or bicyclic ring system/(A) to (G), as
defined above;
R is a group of formula (a), (b), (c), (d), (e), (i) or (j) as
defined above;
20 R₁ is hydrogen, C₁-C₄ alkyl or C₂-C₄ alkanoyl;
R₂ is hydrogen;
n is defined above; and the pharmaceutically acceptable salt
thereof.

3. A compound of formula (I), according to claim 1, wherein
Y is a bicyclic ring system of formula (A), (B) or (E), as
defined above;
R is a group of formula (a),(d),(e),(i) or (j), as defined above;
5 R₁ and R₂ are hydrogen;
n is zero or 1; and the pharmaceutically acceptable salts
thereof.
4. A compound selected from the group consisting of the following
which, when appropriate, may be either Z- or E-diastereoisomers
10 or Z,E- mixtures of said diastereoisomers:
2-cyano-3-(2-hydroxynaphth-1-yl)acrylamide;
2-cyano-3-(3-hydroxynaphth-1-yl)acrylamide;
